

Grainger and Allison, in their textbook, "Diagnostic Radiology" (2nd. Ed.) Cite

as a complication of lumbar injection of chymopapain.

" chymopapain inadvertently entering the subarachnoid space"

as a cause of "severe necrotizing arachnoiditis". ([5])

They also show images of a case of severe arachnoiditis following percutaneous discolysis with chymopapain. Axial CT scan after myelography showed matted nerve roots forming irregular filling defects within the thecal sac.

I note that Alexander, a doctor in the US Navy working in the Orthopaedic Centre at Oakland, remarks on the following contraindications for chemonucleolysis ([6]): cauda equina syndrome, Failed Back Surgery Syndrome, sequestered disc fragment, spinal instability, severe spinal stenosis and of course allergy to chymopapain.

Alexander also suggests

" the overall incidence of neurologic complications is about 0.05% ",

basing this on cited articles ([7], [8]) as well as his own previous clinical experience ([9]).
